

Trolley Collector

◆ **Basic Parameter:**

Rated Current:60A,100A

Number of Poles:3P,4P,5P,6P

Applications:

The crane collector is an electrical switch device on the crane, which is used to control the running direction and working status of the crane. It realizes the connection and switching of the circuit through conductive materials and transmission devices, thereby controlling the movement of the crane.

Features:

By switching the contacts of the collector, the direction of the motor current can be changed, thereby controlling the direction of the crane's operation (forward or backward).

The collector can control the lifting, walking and other actions of the crane, and realize various operations of the crane.

The collector acts as a switch, connecting or disconnecting the circuit when necessary, controlling the on and off of the current, thereby realizing the control of the crane.
