

Cable Drum

◆ Basic Parameter:

Product Dimensions: 650*550*50mm (Customizable)

Product Inner Diameter: 250mm (Customizable)

Product Inner Width: 300mm (Customizable)

Wrapping Length: 1000m-2500m (Customizable)

Color: Customizable

Customization Supported

Applications:

It is primarily used to carry cables, smoothly releasing them through rotation, thus greatly improving construction efficiency and reducing cable damage during the release process. The design of a cable reel typically considers various factors such as cable specifications, weight, and the construction environment to ensure it meets the needs of different scenarios.

cable drum mainly consists of a reel body, a shaft, and a support structure. The reel body is usually circular to provide sufficient space for winding the cable. The shaft is the core of the reel; it bears the weight of the cable and releases it through rotation. The support structure is used to fix the reel, ensuring its stability during construction.
